

Here follows a list of things which are true, but perhaps not useful:

from TI000388

HAM_2_3

1. V2 GS-I3 is critical for measure the RY tilt motion
2. RY is key for Suspension point motion control
3. L-4C for feedforward at installed for HEPI, but not on stage 0.
4. GS-I3 has 6 flexures, top 3 are load bearing, but the bottom 3 are not.
5. 6 flexures means that slight misalignments of a flexure can result in extra stiffness of the mass.
6. Damping is now done in the CART basis, but could be done in local basis, with good performance. V2

ISI_CUST_CHAMBER_GS132CART.adl

H1	H2	H3	V1	V2	V3	HAM3
0.57735	-0.5773	0.00000	0.00000	0.02445	-0.0244	X
0.33333	0.33333	-0.6666	-0.0282	0.01411	0.01411	Y
-0.4906	-0.4906	-0.4906	0.00000	0.00000	0.00000	RZ
0.00000	0.00000	0.00000	0.33333	0.33333	0.33333	Z
0.00000	0.00000	0.00000	0.84667	-0.4233	-0.4233	RX
0.00000	0.00000	0.00000	0.00000	0.73324	-0.7332	RY

can't sense rotation about this axis if V2 is broken

$$\begin{bmatrix} X \\ Y \\ rZ \\ Z \\ rX \\ rY \end{bmatrix} = \text{HAM_2_3: GS132CART} = \begin{bmatrix} 0.5773 & -0.5773 & 0 & 0 & 0.0244 & -0.0244 \\ 0.3333 & 0.3333 & -0.6667 & -0.0282 & 0.0141 & 0.0141 \\ -0.4906 & -0.4906 & -0.4906 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0.3333 & 0.3333 & 0.3333 \\ 0 & 0 & 0 & 0.8467 & -0.4233 & -0.4233 \\ 0 & 0 & 0 & 0 & 0.7332 & -0.7332 \end{bmatrix} \times \begin{bmatrix} H1 \\ H2 \\ H3 \\ V1 \\ V2 \\ V3 \end{bmatrix}$$

$$\begin{bmatrix} H1 \\ H2 \\ H3 \\ V1 \\ V2 \\ V3 \end{bmatrix} = \text{cart2GS13} = \begin{bmatrix} 0.8660 & 0.5000 & -0.6794 & 0.0000 & 0.0167 & -0.0289 \\ -0.8660 & 0.5000 & -0.6794 & 0.0000 & 0.0167 & 0.0289 \\ 0.0000 & -1.0000 & -0.6794 & 0.0000 & -0.0333 & -0.0000 \\ 0 & 0 & 0 & 1.0000 & 0.7874 & 0.0000 \\ 0 & 0 & 0 & 1.0000 & -0.3937 & 0.6819 \\ 0 & 0 & 0 & 1.0000 & -0.3937 & -0.6819 \end{bmatrix} \times \begin{bmatrix} X \\ Y \\ rZ \\ Z \\ rX \\ rY \end{bmatrix}$$

But if V2 is dead, Try this matrix instead

$$\begin{bmatrix} X \\ Y \\ rZ \\ Z \\ rX \\ rY \end{bmatrix} = \begin{bmatrix} 0.5768 & -0.5771 & 0.0003 & 0.0073 & 0 & -0.0171 \\ 0.3330 & 0.3335 & -0.6665 & -0.0240 & 0 & 0.0183 \\ -0.4906 & -0.4906 & -0.4906 & 0 & 0 & 0 \\ -0.0076 & 0.0038 & 0.0038 & 0.4330 & 0 & 0.4330 \\ 0.0096 & -0.0048 & -0.0048 & 0.7201 & 0 & -0.5499 \\ -0.0166 & 0.0083 & 0.0083 & 0.2192 & 0 & -0.5141 \end{bmatrix} \times \begin{bmatrix} H1 \\ H2 \\ H3 \\ V1 \\ V2 \\ V3 \end{bmatrix}$$

generates signals for all DOFS from 5 sensors

$$\begin{bmatrix} X \\ Y \\ rZ \\ Z \\ rX \\ rY \end{bmatrix} = \text{Result} * \text{cart2GS13} = \begin{bmatrix} 0.9993 & -0.0004 & 0.0000 & -0.0098 & 0.0125 & -0.0216 \\ -0.0004 & 0.9998 & -0.0000 & -0.0057 & 0.0072 & -0.0125 \\ -0.0000 & 0.0000 & 1.0000 & -0.0000 & 0.0000 & 0.0000 \\ -0.0098 & -0.0057 & -0.0000 & 0.8659 & 0.1703 & -0.2949 \\ 0.0125 & 0.0072 & -0.0000 & 0.1703 & 0.7838 & 0.3745 \\ -0.0216 & -0.0125 & 0.0000 & -0.2949 & 0.3745 & 0.3513 \end{bmatrix} \times \begin{bmatrix} X \\ Y \\ rZ \\ Z \\ rX \\ rY \end{bmatrix}$$

2 **but they stink (this should be the identity matrix)**

What happens to the ability to measure the cartesian motion when you are missing the V2 sensor? - It's bad.

This is the projection of real CART motion to sensed CART motion
Using the current matrix with a dead V2 sensor

sensed motion = Result * cart2GS13 =

X	1.0000	0	0	-0.0240	0.0100	-0.0170	X
Y	0	1.0000	0	-0.0140	0.0060	-0.0100	Y
rZ	0	0	1.0000	0	0	0	rZ
Z	0	0	0	0.6670	0.1310	-0.2270	Z
rX	0	0	0	0.4230	0.8330	0.2890	rX
rY	0	0	0	-0.7330	0.2890	0.5000	rY

this is bad

This is the projection of real CART motion to sensed CART motion
Using the pseudo-inverse of the sensing matrix with a dead V2
(rounded to 3 sig figs)

Result * cart2GS13 =

X	0.9990	0	0	-0.0100	0.0120	-0.0220	X
Y	0	1.0000	0	-0.0060	0.0070	-0.0120	Y
rZ	0	0	1.0000	0	0	0	rZ
Z	-0.0100	-0.0060	0	0.8660	0.1700	-0.2950	Z
rX	0.0120	0.0070	0	0.1700	0.7840	0.3750	rX
rY	-0.0220	-0.0120	0	-0.2950	0.3750	0.3510	rY

this is still bad
