Pcal End Station Power Sensor Responsivity Ratio Measurements: Procedures and Log

Pcal Team

California Institute of Technology LIGO Project

Massachusetts Institute of Technology LIGO Project

LIGO Hanford Observatory

LIGO Livingston Observatory

http://www.ligo.caltech.edu/

End Station: EX Date: 24 09 2024 Sphere Name and Number: PS4 Measurements Performed By: 1544 Dripta
Items to take to the end station for the measurements:
Working Standard (in protective case)
CDS Laptop including the power chord
PD Satellite Box (blue box), D1300368
• Long (25') DB9 cable
DB9/BNC male to DB9 female temperature cable
BNC cable
A Fluke handheld digital voltmeter
Martel calibrated voltage source, banana-to-BNC adapter cable, and charger/AC adapter
IR-only laser glasses (for use ONLY if work in the ALS laser enclosure, which could expose the VEA to green laser light, will not be ongoing in parallel)
IR viewing cards: high-power (white) and low power (orange)
1.5 mm allen key to remove input aperture cover from Working Standard
Handheld IR Viewer
Before (or after) going to the End Station
• Check the calibration of the Keithley Model 2100 voltmeter using the Marter Cambrater Voltage source at following three different voltages (the same one that will be taken to the end station). Note: use negative polarity.
-4.000\ V on Keithley 2100 DVM
V on Keitnley 2100 DV W
2. (-2 V): with Martel =
1 Before starting Pcal work in VEA
Call the Control Room (ext. 202) to notify them of the laser status change.
Transition VEA to LASER HAZARD status.

LIGO-T1500062-v18

- Plug in the Blue Satelite Box to the WS_PD connector on the PCAL Chassis, using the DB9/BNC male to DB9 female to power the Blue box. Ensure the Power Source switch on the back is in the proper setting. Plug the BNC cable into the FLuke Voltmeter for now. Plug in the integrating sphere while it is sitting in a safe location. Power on the power sensor and take note of the current temperature of the on-board AD590 using the Fluke Voltmeter.
 - WS on-board temperature: 295.0 K
- Make sure that the IFO's ISC LOCK Gaurdian is in a down or idle state, and that it will not try to auto lock. (sitemap / GRD / ISC OVERVIEW)

 DO NOT CHANGE STATE OF GUARDIAN UNLESS APPROVED BY THE ONSHIFT OPERATOR
- Close the ALS laser shutter via the MEDM screen (sitemap/LSC/Shutters/ISCTX(Y) green beam.) This protects you from the 50 mW ALS green lasers
- Check that SEI ENV is set to Maintenance Mode to Shut Off Sensor correction (The Operator should have done this for Tuesday Maintenance but check anyways.) (sitemap/SEI/ISI SENSOR CONFIG)

1.1 Before starting the measurements

- Turn PCAL Interlock bypass to the ON position.
- Set shutter to local
- Disable all three excitations on the Pcal MEDM screen (sitemap/Cal/PcalX(Y)/Excitation):
 - 1. H(L)1:CAL-PCALX(Y)_SWEPT_SINE
 - 2. 'H(L)1:CAL-PCALX(Y)_OSC_SUM
 - 3. H(L)1:CAL-INJ_MASTER_SW
- Ensure that the ETM pointing is in the "aligned" state, If you cannot tell from the medm screen call the operator and ask them. LSC -> LOCKING -> ALIGN IFD -> ETMX(Y)
- Remove cover from Rx enclosure and verify that Pcal beam spots are close to their nominal locations (centered on the Rx sensor input aperture). If they are not, adjust their positions using the final steering mirrors inside the output section of the Tx module enclosure.
- Open a GPS Clock window (type gpsclock & in a terminal window).

Open StripTool (type StripTool & in a terminal window) and display the follow	ving
four sensor outputs. Always verify that signals are stable before recording time sen	ries.

- 1. H(L)1:CAL-PCALX(Y)_TX_PD_WATTS_OUTMON
- 2. H(L)1:CAL-PCALX(Y)_RX_PD_WATTS_OUTMON
- 3. H(L)1:CAL-PCALX(Y)_WS_PD_OUTMON
- 4. H(L)1:CAL-PCALX(Y)_OFS_PD_OUTMON

Make sure the OFS is not railed, if it is turn the loop off and back on.

2 Calibration measurements

2.1 Preliminary measurements

2.1.1 Record Optical Follower Servo (OFS) settings

- Offset: 3 · 85 V
- Gain: 39.6 dB
- OFS PD: -3.833 V

2.1.2 Calibrate the Working standard channel

- Connect Martel Calibrated Voltage Source to INPUT 1 on the *BNC to DB9* interface module mounted in the Pcal transmitter pylon. Note: use negative polarity, and adjust Range to 0.000 to allow up to 4V.
- Inject the three following input voltages for 15 seconds each and record the GPS time and the output level displayed on the StripTool for each 15 second interval.
 - 1. (-4 V): GPS Start Time 1411 229 345; Voltage = -3.9957 V
 - 2. (-2 V): GPS Start Time 1411 229 315; Voltage = -1.9981 V
 - 3. (0 V): GPS Start Time 1411 229 415; Voltage = -0.0004 V

2.1.3 Record Working Standard temperature

- Measure the Working Standard on-board temperature using at DVM at the BNC output of the DB9/BNC to DB9 cable. Multiply the voltage by 100 to obtain the temperature in K.
 - GPS time: 1411 229 552
 - WS on-board temperature: 300.6 K 40% Rel. humidity

2.2 Power sensor measurements

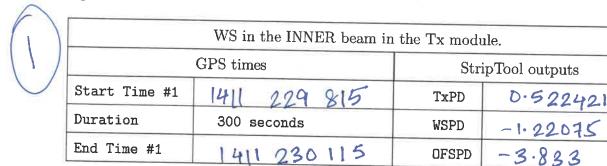

- Connect the Pcal Satellite Box PD MON output to INPUT 1 on the **BNC to DB9** interface module mounted in the Pcal transmitter pylon.
- Record GPS start and end times and nominal StripTool output levels during the measurements.

2.2.1 Measurement 1:

- Block the OUTER beam with a razor blade beam block in the Tx module.
- Loop cable around something to ensure that the sphere doesn't fall when the cable is stepped on.

٧

Place the WS in the INNER beam in the Tx module.

2.2.2 Measurement 2:

- Move the beam block to the INNER beam in the Tx module.
- Move the WS to the OUTER beam in the Tx module.

	WS in the OUTER beam i	n the Tx mod	ule.
	GPS times	Str	ipTool outputs
Start Time #2	1411 230 420	TxPD	0.52266 W
Duration	300 seconds	WSPD	-1.23017 V
End Time #2	1411 230720	OFSPD	-3.83267 V

2.2.3 Measurement 3:

- Leave the WS in the OUTER beam in the Tx module with the INNER beam blocked.
- Close the shutter in the Tx module.

2.2 Power sensor measurements

- Connect the Pcal Satellite Box PD MON output to INPUT 1 on the BNC to DB9 interface module mounted in the Pcal transmitter pylon.
- Record GPS start and end times and nominal StripTool output levels during the measurements.

Long measurement for opt. eff. investigation 2.2.1 Measurement 1:

Block the OUTER beam with a razor blade beam block in the Tx module.

• Loop cable around something to ensure that the sphere doesn't fall when the cable is NOT PART OF stepped on.

• Place the WS in the INNER beam in the Tx module.

REGULAR MEAS.

	WS in the INNER beam in	the Tx modu	ıle.	
	GPS times	Str	ipTool outputs	
Start Time #1	1411 232 615	TxPD	0.522521	W
Duration	400 seconds	WSPD	-1-21981	V
End Time #1	1411 233 515	OFSPD	3.8325	٧

Long measurement for opt. eff. investigation the INNER beam in the Tx module. Measurement 2:

Move the beam block to the INNER beam in the Tx module.

 Move the WS to the OUTER beam in the Tx module. REGULAR MEAS

End Time #8	1411238206	OFSPD	-3.8317	v

2.2.9 Measurement 9:

• CLOSE the shutter in the Tx module.

Shutter CLOSED in the Tx module.				
GPS times		StripTool outputs		
Start Time #9	1411 238 249	2 1	TxPD	+:4.8916e-5 W
Duration	60 seconds		RxPD	- 4.6942e-5 W
End Time #9	1911238 309	N.	OFSPD	-0.01017 V

2.2.10 Before leaving VEA

OPEN the shutter in the Tx module.

2. Set the shutter control to Remote on interface module.

2. Replace the enclosure covers on both the Tx & Rx modules

A. Re-enable the three excitations on the Pcal MEDM screen (if applicable)

5. Make sure ALL covers are back on before Turning the interlock bypass to OFF.

- 6. Transition VEA back LASER SAFE status
- 7. Call the Control Room (ext. 202) to notify them of the laser status change and that they may unshutter ALS and take the SEI ENV to CALM if they wish to start Locking.

Trained) as 1) .

2.2.11 To complete the end station measurement effort

- Analyze the data (see Section 3) and upload results to the GIT.
- Make an aLog entry; append images of the beam spots at the Rx power sensor aperture.

3 Data Retrieval and calculations

3.1 Data Acquisition, Plots and Report

- Log in to the CDS laptop as yourself to avoid username and permissions issues. If you are already logged in as controls you can use the terminal command su firstname.lastname to log in to the terminal as your self, but you will only be logged into the terminal so you will have to use terminal editors like nano or VIM.
- 2. Make sure that the Local PCAL Git Repo on CDS machines is up to date with the latest version of the master branch. Navigate to /ligo/gitcommon/Calibration in a terminal and run the git status and git pull commands. If you run into any issues, read the README.md file found on the Remote Git lab Repo found here: https://git.ligo.org/Calibration/pcal.
